

# Tsunamis on the move . . .

**Tsunamis . . .** Are a series of long-wavelength, long-period ocean waves. They are not surfing waves. Come ashore for hours. The first wave may not be the largest. Are caused primarily by earthquakes occurring below or near the seafloor. Are less frequently caused by underwater volcanic eruptions, landslides, slumps, and meteorites.

**Tsunamis . . .** Travel at jet airliner speeds in the deep ocean, but the waves are only centimeters high and cannot be felt aboard ships. When tsunamis hit shallow water, they slow and their height grows tremendously. Can crest to 10-m high heights, strike with devastating force, and quickly flood all low-lying coastal areas. Threaten life and property.

*Tsunamis slow down but grow in size as they come ashore.*

## Knowledge is Safety: Tsunami Warning Signs . . .

An earthquake is one of nature's tsunami warning signs. If you're at the beach and the ground shakes so hard you can't stand up, a tsunami may have been generated. Tsunami may be preceded by a rapid fall in sea level as the ocean retreats exposing fish and rocks on the sea bottom. A roar like an oncoming train may be heard as a tsunami rushes toward the shore.

## What you should do . . .

After an earthquake, move quickly inland and to higher ground. Tsunami from a local earthquake can strike in minutes, and before a tsunami warning is announced. Tsunami from distant locations can take up to 24 hours to cross an ocean basin. Tsunami warnings will be announced advising coastal evacuation to safe shelters.

Learn to recognize nature's warnings. Heed official tsunami warnings. Stay away from rivers and streams. If you see a tsunami, you may not be able to outrun it. Look for a sturdy, multi-storied, reinforced concrete building and climb to its highest floor or the roof. If there is no time, climb up and cling to a strong tree. If you're swept up by a tsunami, look for something to help you stay afloat, and to protect you from dangerous floating debris like houses, cars, and trees.
